ABSTRACT
The Dilu dialect (spoken in Mengshan, Guangxi) shows, disparity in the
categorization of phonation types in phonetic and phonological analyses.
While the phonological analysis proposes that Dilu operates with two
phonation types, i.e. creaky and modal, phonetic facts show a three-way
distinction, i.e. creaky, male modal and female modal. In this paper
acoustic features are investigated for modal and creaky voices in Dilu.¹ In
particular, the parameters of Open Quotient (OQ) and Speed Quotient (SQ)
are examined. We discuss whether it is necessary and possible for female
and male modal voices to collapse into one category to serve the purpose
of phonological transcription. Finally, based on an independent five-level
tone scale, we propose a tone transcription system for languages that have
various phonation types.

1. INTRODUCTION
With the development of speech science and its application, more
and more tone-related features and linguistically significant phonation
types have been discovered and identified.

擠喉音的發聲模式和標調方法
一一來自蒙山底路話的調查分析結果

關英偉
廣西師範大學，桂林

提要
從語音學角度來看，蒙山底路話中存在三個嗓音類型：擠喉嗓音，男性正常嗓音和女性正常嗓音。從音位學角度來看，只存在擠喉嗓音和正常嗓音的對立。根據蒙山底路話聲調系統的這一特性，在本文中我們分析了蒙山底路話聲調系統中擠喉嗓音的聲學特徵，根據開合和速度商參數，討論了蒙山底路話擠喉嗓音的發聲模式；還討論了在音位處理過程中，男女正常嗓音轉換的可能性和必要性；提出了在多聲域語言中根據不同嗓音類型用不同的五度標尺的標調框架。
